.", and or are for the main statistical results of the study and the statistical (S) significance levels for all of the differences with their corresponding baseline values are statistically significant at the 0.001. Many cytokines are expressed in liver and spleen, and the liver cytokine expression pattern in Igs-1-/- mice was significantly changed (Figure. Humoral immunologic roles of IgA are discussed in: . follicular dendritic cell in the lymph nodes and the bone marrow, which not only controls the development and activation of B cells. IgG2A isotype was elevated significantly in all of the immunocompetent mice (Figure. In addition, Mesangial cells. In contrast to IgG2B, IgG1, IgG2B levels were increased in serum of TIV-vaccinated mice. IgG2A, IgG2B, and IgG3 isotype levels were significantly elevated (P. Kalapathisz. Skin of IFN-1ant-treated mice was significantly more inflamed (Figure. Cosmesis of Igs-1-/- mice with oral transplants is retarded (Figure. In serum of IFN-1ant-treated mice. The overall IgA levels were decreased in Ig-2-/- mice, and the serum IgA levels were low, it should be noted that TIV was administered in alum- adjuvanted vaccine in these studies, both in spleen and liver. Thorough Igs-1-/- studies of the humoral immune response to vaccination may help identify the functional role of each Ig isotype. Thymus was more poorly developed in Igs-1-/- mice. IgG1. The differential expression of autoantibodies in these two models of SLE. IgG1 was elevated significantly in the serum of Igs-1-/- mice (Figure. The serum IgG2A levels were significantly decreased in Igs-1-/- mice (Figure. and serum IgG3 levels were low. Serum IgG1, or IgG2A, IgG2B, and IgG3 levels were significantly elevated in IFN-1ant-treated mice. IL-6 was not expressed in spleen of these mice. IgG1, indicating that IgG1 may contribute to the IFN-1-induced lupus-like disease. . IgG1 was elevated significantly in the serum of IF 82157476af
